

FUNCTIONAL REQUIREMENTS DOCUMENT

Project: Planify | **Baseline:** Functional (BL1) | **Version:** 1.0

Overview

This document captures the functional requirements for the Planify application at Functional Baseline (BL1). Each requirement is stated succinctly and uniquely identified to support traceability, verification, and future change control.

Requirements

- **REQ-01 — Authentication Layer**

The system shall provide a secure Login and Signup gateway leveraging Firebase Authentication. Authentication flows must include robust error mapping and user-facing messages for invalid credentials, expired sessions, and account lockout conditions. All authentication events shall be logged for audit and diagnostic purposes.

- **REQ-02 — Temporal Horizon Dashboards**

The system shall present distinct tracking interfaces corresponding to four temporal horizons:

- **Daily Focus:** Interface optimized for short-term, day-by-day tasks.
- **Weekly Sprints:** Dashboard for mid-term goals and sprint-oriented work.
- **Monthly Horizon:** Aggregate view for strategic, month-level objectives.
- **Yearly Vision:** High-level roadmap for long-term planning and milestones.

Each horizon shall provide tailored filtering, progress indicators, and summary statistics appropriate to its time scale.

- **REQ-03 — Plan Creation (Core Action)**

Users shall be able to create a new **Plan** within any temporal horizon. Each **Plan** must include a required name and a dedicated rich-text architectural editor that supports formatting, embedded links, and minimal structural elements (headings, lists). Created plans shall be versioned and attributable to the creating user.

- **REQ-04 — Global Search**

The system shall provide a real-time global search bar capable of filtering plans across all temporal horizons by keyword input. Search results shall update interactively as the user types and support basic relevance ranking (title match, recent updates, user ownership).

- **REQ-05 — Persistent Data**

All user data, including authentication metadata, plans, and horizon state, shall be persisted in Cloud Firestore. Data shall persist across browser sessions and be available on subsequent authenticated

logins. The persistence model shall consider security rules, indexing for search, and efficient reads/writes to minimize cost and latency.
